Python Programming Fundamentals Cheat Sheet

Package/Method	Description	Syntax and Code Example Syntax:
AND		1 statement1 and statement2
		Example:
		1 marks = 90 2 attendance_percentage = 87
	Returns 'True' if both statement1 and statement2 are 'True'. Otherwise, returns 'False'.	3
		4 if marks >= 80 and attendance_percentage >= 85: 5 print("qualify for honors")
		6 else: 7 print("Not qualified for honors")
		8 9 # Output = qualify for honors
		Syntax: 1 class ClassName: # Class attributes and methods 🖆
	Defines a blueprint for creating objects and defining their attributes and behaviors.	Example:
Class Definition		1 class Person:
		<pre>definit(self, name, age): self.name = name</pre>
		4 self.age = age
		Syntax:
		1 def function_name(parameters): # Function body
Define Function	A 'function' is a reusable block of code that performs a specific task or set of tasks when called.	Example:
		1 def greet(name): print("Hello,", name)
		Syntax:
		1 variable1 == variable2
		Example 1:
		1 5 == 5
Equal(==)	Checks If two values are equal.	returns True
		Example 2:
		1 age = 25 age == 30
		returns False
		Syntax: 1 for variable in sequence: # Code to repeat @
		Example 1:
		1 for num in range(1, 10):
For Loop	A 'for' loop repeatedly executes a block of code for a specified number of iterations or over a sequence of elements (list, range, string, etc.).	2 print(num)
		Example 2:
		<pre>fruits = ["apple", "banana", "orange", "grape", "kiwi"] for fruit in fruits:</pre>
		2 for fruit in fruits: 3 print(fruit)
		Syntax:
		1 function_name(arguments) 연
Function Call	A function call is the act of executing the code within the function using the provided arguments.	Example:
		1 greet("Alice") ℓੀ
		Syntax:
		1 variable1 >= variable2
	Checks if the value of variable1 is greater than or equal to variable2.	Example 1:
		1 5 >= 5 and 9 >= 5
Greater Than or Equal To(>=)		returns True
		Example 2:
		1 quantity = 105 2 minimum = 100
		3 quantity >= minimum
		returns True
		Syntax:
		1 variable1 > variable2 ℓ½
		Example 1: 9 > 6
Creates There's	Charles If the value of undebted in provide the undebted.	returns True
Greater Than(>)	Checks if the value of variable1 is greater than variable2.	Example 2:
		1 200 - 70

		2 max_age = 25 3 age > max_age
If Statement	Executes code block `if` the condition is `True`.	Syntax: 1 if condition: #code block for if statement @ Example:
If-Eiif-Eise	Executes the first code block if condition1 is 'True', otherwise checks condition2, and so on. If no condition is 'True', the else block is executed.	1 if temperature > 30: 2 print("It's a hot day!") Syntax: 1 if condition1: 2 # Code if condition1 is True
		a elif condition2: # Code if condition2 is True else: # Code if no condition is True
		Example: 1
If-Eise Statement	Executes the first code block if the condition is 'True', otherwise the second block.	Syntax: 1 if condition: # Code, if condition is True 2 else: # Code, if condition is False Example: 1 if age >= 18: 2 print("You're an adult.") 3 else: 4 print("You're not an adult yet.")
Less Than or Equal To(<=)	Checks if the value of variable1 is less than or equal to variable2.	Syntax:
Less Than(<)	Checks if the value of variable1 is less than variable2.	Syntax: 1
Loop Controls	'break' exits the loop prematurely. 'continue' skips the rest of the current iteration and moves to the next iteration.	Syntax: 1
		1 for num in range(1, 6): 2 if num == 3: 3 continue 4 print(num)

NOT	Returns 'True' if variable is 'False', and vice versa.	Syntax: 1 Ivariable 연 Example: 1 Ifstocked 연 returns True if the variable is False (i.e., unlocked).
Not Equal(l=)	Checks if two values are not equal.	Syntax: 1
Object Creation	Creates an instance of a class (object) using the class constructor.	Syntax: 1 object_name = ClassName(arguments) Example: 1 person1 = Person("Alice", 25)
OR	Returns 'True' if either statement1 or statement2 (or both) are 'True'. Otherwise, returns 'False'.	Syntax: 1 statement1 statement2 ② Example: 1 "Farewell Party Invitation" 2 Grade = 12 grade == 11 or grade == 12 ② rotums True
range()	Generates a sequence of numbers within a specified range.	Syntax: 1 range(stop) 2 range(start, stop) 3 range(start, stop, step) Example: 1 range(5) #generates a sequence of integers from 0 to 4. 2 range(2, 10) #generates a sequence of integers from 2 to 0 range(1, 11, 2) #generates odd integers from 1 to 9.
Return Statement	'Return' is a keyword used to send a value back from a function to its caller.	Syntax: 1
Try-Except Block	Tries to execute the code in the try block. If an exception of the specified type occurs, the code in the except block is executed.	Syntax: 1 try: # Code that might raise an exception except 2 ExceptionType: # Code to handle the exception Example: 1 try: 2 num = int(input("Enter a number: ")) 3 except ValueError: 4 print("Invalid input. Please enter a valid number.") ②
Try-Except with Else Block	Code in the 'else' block is executed if no exception occurs in the try block.	Syntax: 1
Try-Except with Finally Block	Code in the 'finally' block always executes, regardless of whether an exception occurred.	Syntax: 1 try: # Code that might raise an exception except 2 ExceptionType: # Code to handle the exception 3 finally: # Code that always executes Example: 1 try: 2 file = open("data.txt", "r") 3 data = file.read() 4 except fileMotFoundError: 5 print("File not found.") 6 finally: 7 file.close()
